A method for serum type classification of TT virus (also known as hepatitis TT virus) has been identified. The method relies on the use of peptide fragments of the virus. The invention also relates to the use of TT virus peptides for anti-TT virus antibody determination. The anti-TT virus antibodies and the serum type classification method, can be used to screen TT virus, to determine its route of infection, and seroconversion.

thod, can be used to and seroconversion.

The antibody has antiinflammatory, antipsoriatic, antirheumatic, antidiabetic, antiatherosclerotic, cytostatic and osteopathic activities and may be an ECRTP/DEP-1 modulator, ECRTP/DEP-1 dimerisation promoter or antagonist and angiogenesis inhibitor. The purified antibody blocks endothelial migration and proliferation and inhibits angiogenesis in disorders such as inflammatory disorders including immune and non-immune inflammation, chronic articular rheumatism and psoriasis, disorders associated with inappropriate invasion of vessels such as diabetic retinopathy, neovascular glaucoma, capillary proliferation in atherosclerotic plaques, osteoporosis and cancer associated disorders such as solid tumours, solid tumour metastases, angiofibromas, retrolantal fibronlasis, homenoricae wasnesses, angiofibromas,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             retrolental fibroplasia, hemangiomas, Kaposi's sarcoma and similar cancers. This sequence is peptide sequence #1 for epitope ECRTP/DEP-1 ectodomain binding antibody used to modulate angiogenesis, described in the method of the invention.

Note: This sequence for ECRTP/DEP-1 epitope, given in example 4, differs from that given in claim 3 (AAU08802).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention describes a novel purified antibody (or its fragment or derivative) which preferentially binds an endothelial cell receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (COLD-) COLD SPRING HARBOR LAB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Density enhanced

Sequence
                  DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.

                    The present sequence is the protein sequence for a human transcription factor. The transcription factor and its coding sequence are useful in the diagnosis, treatment and prevention of diseases associated with altered expression of the transcription factor e.g. cell proliferative, autoimmune/inflammatory, neurological and developmental disorders. A number of specific disorders/diseases are given in the specification,
                                                                                                                                                                                                                                                          Hillman

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins

                                         The invention relates to novel genes (AAI62752-AAI62961) and proteins (AAM42347-AAM42415) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification.
isolated from a range of human the nucleic acids, proteins, and in the diagnosis, treatment and
                                                                                                                                                                       Claim 11;
                                                                                                                                                                                                              Novel plasma membrane associated proteins useful for diagnosing, treating, preventing and/or prognosing disorders related to the proteins, including cancer, immune response and neuronal disorde

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

tyrosine + phosphate.
-I- SUBCELLULAR LOCATION: Type I membrane protein.
-I- PTM: N- AND O-GLYCOSYLATED.
-I- SIMILARITY: CONTAINS 1 PROTEIN-TYROSINE PHOSPHATASE DOMAIN.
-I- SIMILARITY: CONTAINS 5 FIBRONECTIN TYPE III-LIKE DOMAINS.
-I- DATABASE: NAME=PROW; NOTE=CD guide CD148 entry;

CATALYTIC ACTIVITY: RH + reduced flavoprotein + O(2) = Oxidized flavoprotein + H(2)O.

SUBCELLULAR LOCATION: Membrane-bound. Endoplasmic retices specificity: Expressed at high Levels in the INN THE ADRENAL CORTEX.

SIMILARITY: BELONGS TO THE CYTOCHROME P450 FAMILY.

-I- FUNCTION: This protein is involved in the repair of mismatches in DNA. It is possible that it carries out the mismatch recognition step. This protein has a weak ATPase activity (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CONFLICT
